Welcome to STN International							
Web Page URLs for STN Seminar Schedule - N. America							
NEWS 1	"Ask CAS" for self-help around the clock						
NEWS 2	PATDPAFULL - New display fields provide for legal status						
NEWS 3	data from INPADOC						
NEWS 4	BABA - Current-awareness alerts (SDIs) available						
NEWS 5	BABA - Current-awareness alerts (SDIs) available						
FEB 28	NEWS 5	MAR 02	GBFULL: New full-text Patent database on STN				
NEWS 6	REGISTRY/ZREGISTRY - Sequence annotations enhanced						
NEWS 7	MELLINE file segment of TOXCENTER reloaded						
NEWS 8	KOREPAT now updated monthly; Patent information enhanced						
NEWS 9	Original IDE display format returns to REGISTRY/ZREGISTRY						
NEWS 10	Original IDE display format returns to REGISTRY/ZREGISTRY						
NEWS 11	PATDPAFULL - New Patent database available						
NEWS 12	REGISTRY/ZREGISTRY enhanced with experimental property fields						
NEWS 13	EPFILE enhanced with additional patent information and new fields						
APR 04	EMBASE - Database reloaded and enhanced						
APR 18	New CAS Information Use Policies available online						
APR 25	Patient searching, including current-awareness alerts (SDIs) based on application date in CA/CAplus and USPATFULL/USPAT applications						
APR 04	may be affected by a change in filing date for U.S. applications						

NEWS 16 APR 28 Improved searching of U.S. Patent Classifications for

U.S. Patent records in CA/CAPLUS

NEWS 17 MAY 23 GBFULL enhanced with patient drawing images

NEWS 18 MAY 23 CHEMISTS have been enhanced with source information from

Version 8.0 for Windows now available

NEWS 21 JUN 13 RUSSIAPAT: New full-text patent database on SIN

NEWS 22 JUN 13 FRFULL enhanced with patent drawing images

NEWS 23 JUN 20 MEDICONF to be removed from STN

NEWS EXPRESS JUNE 13 CURRENT WINDOWS VERSION IS V8.0, CURRENT

MACINTOSH VERSION IS V6.0G(ENG) AND V6.0JC(JP),

AND CURRENT DISCOVER FILE IS DATED 13 JUNE 2005

New CAS Information Use Policies, enter HELP USAGETERMS for details.

TSCA INFORMATION NOW CURRENT THROUGH JANUARY 18, 2005

Please note that search-term pricing does apply when
conducting SmartSELECT searches.

*****+
* The CA roles and document type information have been removed from *
* the IDE default display format and the ED field has been added, *
* effective March 20, 2005. A new display format, iDERL, is now *
* available and contains the CA role and document type information. *
*+
*+
* Crossover limits have been increased. See HELP CROSSOVER for details.
* Experimental and calculated property data are now available. For more
* information enter HELP PROP at an arrow prompt in the file or refer
* to the file summary sheet on the web at:
* http://www.cas.org/ONLINE/DBSS/registries.html

II

AB Title compds. I [wherein R1 and R2 = independently H, halo, (hydroxy)amino, CN, NO₂, (perfluoro)alkyl, (perfluoro)alkylthio, (perfluoro)alkylsulfonyl, alkylsulfinyl, sulfonamido, OR₅, or CO₂R₆; R₃ = (un)substituted unbranched (hetero)alkyl; OR₅ = (hetero)cycly; R₄ = CONHR₆ or (un)substituted heteroaryl; R₅ = H or (perfluoro)alkyl; R₆ = alkyl; and pharmaceutically acceptable salts thereof] were prepared as glucokinase (GK) activators. For example, reaciton of (3-chloro-4-methylsulfonylphenyl)acetic acid Me ester and trifluoromethanesulfonic acid ((R)-tetrahydrofuran-2-yl)methyl ester (preparation of starting materials given) produced 2-(3-chloro-4-methylsulfonylphenyl)-3-tertbutylduran-2-(R)-yl)propanoic acid Me ester (52%), which was saponified with 0.8M aqueous LiOH to give the acid (95.8%). Amidation with 2-aminopyrazine (66.1%) in the presence of DMF and oxalyl chloride in CH₂Cl₂, followed by oxidation with 30% aqueous hydrogen peroxide afforded II (67.1%). SC1.5 (concentration producing a 50% increase in activity) values of $\leq 30 \mu\text{M}$ for activation of human liver GK1 expressed in E. coli as a glutathione S-transferase fusion protein (GST-GK) were

obtained for all of the synthesized invention compds. Thus, I and their pharmaceutical compns. are useful in the treatment of type II diabetes (no data).

Title compds. [1: R1, R2 = H, halo, amino, hydroxymino, NO₂, cyano, sulfonylido, perfluoroalkyl, alkylthio, alkylsulfonyl, alkylsulfinyl, etc.; R3 = alkyl, cycloalkyl; R4 = certain un- or monosubstituted 5- and 6-membered heterocar. rings connected by a ring C atom; R4 (claims) = un- or monosubstituted triazine, pyrazine, or pyridazine; and their pharmaceutical acceptable salts], were prepared via amidation, for use as glucokinase activators for treatment of type II diabetes. Thus, the invention compound N-(5-chlorothiazol-2-yl)-3-cyclopentyl-2(R)-[4-(methanesulfonyl)phenyl]propanamide (11) was prepared by addition of 3-cyclopentyl-2(R)-[4-(methanesulfonyl)phenyl]propanoic acid (preparation given) to a stirred mixture of triphenylphosphine and N-bromosuccinimide in methylene chloride at 0°, followed by stirring at room temperature for 30 min, addition of a solution of 2-amino-5-chlorothiazole hydrochloride and pyridine in methylene chloride, and stirring at 25° overnight. All of the exemplified compds. I activated glucokinase *in vitro*, exhibiting an IC_{50} of 5-30 μ M. Selected invention compds. exhibited glucokinase activator activity *in vivo* when administered orally to mice. Thus, I are

AB Title compds. [1]; R1, R2 = H, halo, amino, hydroxyamino, NO₂, cyano, sulfonyl, perfluoroalkyl, alkylthio, alkylsulfonyl, alkylsulfanyl, etc.; R3 = alkyl, cycloalkyl; R4 = CONHR40, (substituted) 5-6 membered heterocary; R40 = H, alkyl, alkenyl, hydroxalkyl, haloalkyl, etc., were prepared for treatment of type II diabetes. Thus, 3-cyclopentyl-2-(3,4-dichlorophenyl)propanoic acid (preparation given), benzotriazol-1-ylmethyl(dimethylaminophosphonium hexafluorophosphate, and 2-aminothiazole in CH₂Cl₂ was treated with Et₃N followed by 14 h stirring to give 3-cyclopentyl-2-(3,4-dichlorophenyl)-N-thiazol-2-ylpropionamide. I activated glucokinase in vitro with SC1.530 μM.

L2 ANSWER 6 OF 9 MEDLINE on STN
AB The hormones glucagon and insulin delicately regulate the concentration of blood glucose. When patients become resistant to the effects of insulin or produce too little of it to properly regulate glucose concentrations, then diabetes can result. Unfortunately, not all patients with insulin-resistant, type 2 diabetes mellitus respond to drugs that improve insulin sensitivity. However, there is reason to be hopeful. A new molecule that targets glucokinase (GK), the enzyme responsible for phosphorylating glucose in pancreatic beta cells and hepatic cells, acts to significantly reduce blood glucose concentrations in rodents. The GK activator RO-28-1675 increased the glucose affinity and Vmax of GK, and rats treated with RO-28-1675 had improved glucose tolerance and elevated glucose uptake in liver. These results provide the basis for improved drug design that may alleviate diabetes mellitus and the disorders that accompany it in patients.

L2 ANSWER 7 OF 9 MEDLINE on STN
AB In Type 2 diabetes, glucose homeostasis is impaired due to either a decrease in insulin secretion or insulin action. In this symposium, molecular targets that could have an impact on either or both of these defects were discussed and data related to specific compounds were presented. Protein tyrosine phosphatase 1B inhibitors that relieve the negative control on insulin action and are active in cell assays, dipeptidyl peptidase IV inhibitors that raise postprandial glucagon-like peptide 1 levels in animals and humans, and pyruvate dehydrogenase kinase

inhibitors that increase the levels of pyruvate dehydrogenase, which in turn improve insulin sensitivity, were all discussed. Roche presented for the first time their novel **glucokinase activators** and discussed both the *in vitro* and *in vivo* activity profiles of representative **glucokinase activators** as potential therapy for Type 2 diabetes. Second generation retinoid X receptor modulators that retain the desirable effects of full agonists, while devoid of their negative attributes, such as triglyceride accumulation, were discussed. Also, clinical efficacy results of synthetic exendin-4, Exenatide trade mark, a glucagon-like peptide 1 analogue, were presented. In the area of obesity, agonists of several central (melanocortin type 4, serotonin subtype 2C and cannabinoid receptor 1) receptors and one peripheral G-protein-coupled receptor, cholecystokinin receptor-A, all of which lead to reduced food intake in animals, were discussed.

L2 ANSWER 8 OF 9 MEDLINE on STN

AB Mutations in human glucokinase are implicated in the development of diabetes and hypoglycemia. Human glucokinase shares 54% identical amino acid residues with human brain hexokinase I. This similarity was used to model the structure of glucokinase by analogy to the crystal structure of brain hexokinase. Glucokinase was modeled with both its substrates, glucose and MgATP, to understand the effect of mutations. The glucose is predicted to form hydrogen bond interactions with the side chains of glucokinase residues Thr 168, Lys 169, Asn 204, Asp 205, Asn 231, and Glu 290, similar to those observed for brain hexokinase I. The magnesium ion is coordinated by the carboxylates of Asp 78 and Asp 205 and the gamma-phosphate of ATP. ATP is predicted to form hydrogen bond interactions with residues Gly 81, Thr 82, Asn 83, Arg 85, Lys 169, Thr 228, Lys 296, Thr 332, and Ser 336. Mutations of residues close to the predicted ATP binding site produced dramatic changes in the Km for ATP, the catalytic rate, and a loss of cooperativity, which confirmed our model. Mutations of residues in the glucose binding site dramatically reduced the catalytic activity, as did a mutation that was predicted to disrupt an alpha-helix. Other mutations located far from the active site gave smaller changes in kinetic parameters. In the absence of a crystal structure for glucokinase, our models help rationalize the potential effects of mutations in diabetes and hypoglycemia, and the models may also facilitate the discovery of pharmacological **glucokinase activators** and inhibitors.

L2 ANSWER 9 OF 9 MEDLINE on STN

AB During the screening of the natural products for their ability to increase the activity of glucokinase by relieving inhibition by long chain fatty acyl CoA esters (FAC), two novel compounds, glucolipsin A (1) and B (2) were isolated from the butanol extracts of *Streptomyces purpurogeniscleroticus* WC71634 and *Nocardia vaccinii* WC65712, respectively. The structures of these two compounds were established by spectroscopic methods and chemical degradation. Glucolipsin A (1) and B (2) relieved the inhibition of glucokinase by FAC with RC50 values of 5.4 and 4.6 microM.
